

Mandated Procedure Checklist for MD Boxwood Blight Compliance Agreement

	Know your sources and suppliers.
	Isolate all incoming host plants, on a cleanable surface, for 30 days and inspect weekly.
	Deliver new host plants directly to isolation areas or clean any common loading areas after deliveries.
	No fungicides or pruning in isolation areas during the 30 day waiting period.
	Separate all host plants by source.
	Avoid overhead and late-day watering.
	Prevent water runoff from one production area to another.
	All tools, equipment and surfaces must be disinfected between crop cycles.
	Use new potting medium and sterilized or new pots.
	Report suspect plants to MDA.
	Maintain complete host plant records for 12 months.
	Train appropriate staff on symptoms, sanitation, and compliance agreement.
These additional, nursery-suggested, procedures are strongly recommended, in order to minimize risk of contamination for your operation:	
	All visiting vehicles will enter the nursery through controlled-access points.
	Vehicles will be inspected for plant debris and soil. Dirty vehicles will be denied access or sent for
	decontamination at the nursery's wash-down facility.
	Customers will only tour fields with a nursery-supplied guide, in a nursery-owned vehicle.
	Customers will not exit the tour vehicle to access any boxwood or other host plant block.
